

Creation of a Graphical User Interface with R

Sensitivity study of a model

Application to a Dairy Farm Model

Miriam Amores Gago

Universitat Autònoma de Barcelona

II Jornades Estadística i Software
24-October, 2013

Simulating 1 cow

code `simvaca.R`

INPUTS: PAR.SIM

PAR.SIM

Mean & st. dev. (gest. time):
 280 3

Prob. of sellable meat:
 0.50

Drying at:
 220

Conception rate:
 0.15

Days between inseminations:
 21

Random arrival
 0 1

A value (if random=0)
 15

Law of A (if random=1):
 Uniform
 Binomial
 Triangular1
 Triangular2
 Parabolic

Law of A given by user:
 0 1

† User percentages (adding to 100(!))

RANDOM

- Gestation time (μ, σ)
- Sellable meat ($p = 0.5$)
- Time of natural death (\emptyset)
- Number of failed inseminations ($p = 0.15$)
- Laws (random farm composition) → next

DETERMINISTIC

- Production curve (Wood) → next
- Days between inseminations
- Drying time

Simulating 1 cow

code `simvaca.R`

INPUTS: PAR.SIM

PAR.SIM	
Mean & st. dev. (gest. time):	
280	3
Prob. of sellable meat:	
0.50	
Drying at:	
220	
Conception rate:	
0.15	
Days between inseminations:	
21	
Random arrival	
<input checked="" type="radio"/> 0 <input type="radio"/> 1	
A value (if random=0)	
15	
Law of A (if random=1):	
<input checked="" type="radio"/> Uniform	
<input type="radio"/> Binomial	
<input type="radio"/> Triangular1	
<input type="radio"/> Triangular2	
<input type="radio"/> Parabolic	
Law of A given by user:	
<input checked="" type="radio"/> 0 <input type="radio"/> 1	
* User percentages (adding to 100(!))	

RANDOM

- Gestation time (μ, σ)
- Sellable meat ($p = 0.5$)
- Time of natural death (\emptyset)
- Number of failed inseminations ($p = 0.15$)
- Laws (random farm composition) \rightarrow next

DETERMINISTIC

- Production curve (Wood) \rightarrow next
- Days between inseminations
- Drying time

OUTPUT

- Simulated cow: milk production, gestation length and others

Simulating 1 cow: milk production curve

Wood in 1st, 2nd and other lactations: deterministic function depending on 2 fixed value parameters (B and C) and 1 free parameter A.

Wood function

$$f(x) = Ax^B e^{-Cx}$$

	1st	2nd	others
A	$A_1 \in \{8, \dots, 24\}$	$A_2 = 1.54 \cdot A_1$	$A_3 = 1.47 \cdot A_1$
B	$B_1 = 0.208$	$B_2 = 0.179$	$B_3 = 0.209$
C	$C_1 = 0.002$	$C_2 = 0.003$	$C_3 = 0.0036$

Simulating 1 cow

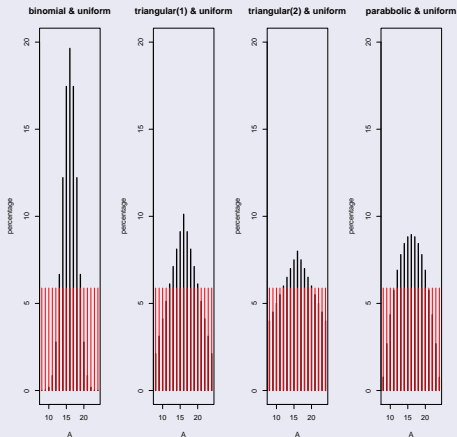

Parameter A determines how productive it is the cow.

Wood function: milk production curve

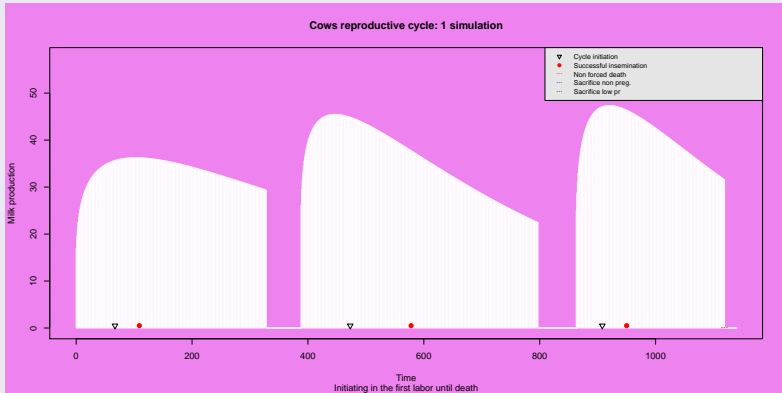

Simulating 1 cow

Laws: Random farm composition ($\%A = 8, 9, \dots$)

Simulating 1 cow

Simulating 1 cow: 3 lactations, production, gestation time...

Profit of 1 cow

code `fbp.R`

INPUTS: PAR.COST + PAR.PRTCL

PAR.COST	PAR.PRTCL
Milk's price: 0.3	Low production thresholds Days in milk 100 200 300
Cow's buying price: 1800	Potential alarms in lac. 1 6000 7000 8000
Cow's selling price: 800	Potential alarms in lac. 2 8500 9000 11000
Fixed cost (if dried): 3.00	Potential alarms in lac. 3 8500 9000 11000
Fixed cost (if productive): 2.50	Number of simulations: 5000
Variable cost (if productive): 0.15	New simulation
Renewal interval: 20	

- Data simulated cow
- Prices and costs
- PROTOCOLS →
next

Profit of 1 cow

code `fbp.R`

INPUTS: PAR.COST + PAR.PRTCL

PAR.COST	PAR.PRTCL
Milk's price: 0.3	Low production thresholds Days in milk 100 200 300
Cow's buying price: 1800	Potential alarms in lac. 1 6000 7000 8000
Cow's selling price: 800	Potential alarms in lac. 2 8500 9000 11000
Fixed cost (if dried): 3.00	Potential alarms in lac. 3 8500 9000 11000
Fixed cost (if productive): 2.50	Number of simulations: 5000
Variable cost (if productive): 0.15	New simulation
Renewal interval: 20	

- Data simulated cow
- Prices and costs
- PROTOCOLS →
next

OUTPUT

- Benefit of a cow

Profit of 1 cow

Thresholds for each period

Profit of 1 cow

Thresholds for each period

Replication to estimate the profit

Replicating many cows \implies Average Profit, st. deviation, etc.

Consecutive simulations

Analysis of the dependence on certain parameters

How to do it?

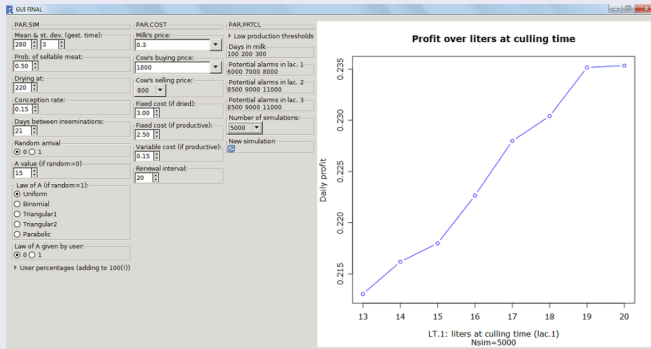

- CODE → User must know well R
 - knowing how to apply the different functions (simvaca, fbp, etc.)
 - changing the values of the parameters inside the functions

```
par.sim <- c(a1eat=1,llei=d1,A0=17,a=2,p=0.15,int=20,m.gest=280,  
            s.gest=3,TM0=0.5,sec=20)  
rs <- simvaca(par.sim)  
par.prtcl <- c(L1=c(15,25,25),L2=c(18,25,25),dates=c(100,  
            200,300,100,200,300),alpot=c(6000,8500,8500,7000,9000,  
            9000,8000,11000,11000))  
par.preus <- c(cost1=c(2.5,0.15),cost0=3,p1l=0.32,pc=1800,  
            pv=800,esp=20)  
li <- taula.li(vA = (8:24), L1 = par.prtcl[1:3],  
            L2 = par.prtcl[4:6], dates = par.prtcl[7:15])  
res <- fbp(li = li, rs, par.prtcl, par.preus)
```

Analysis of the dependence on certain parameters

How to do it?

- Graphical User Interface (GUI)

How to create a graphical user interface for R?

Library gWidgets

- It tries to be a link between R and other libraries
- It's a well documented package with examples
- It quickly creates GUIs
- It follows a logical hierarchy
- It has different types of widgets

4 random variables

4 random variables to simulate the physiologic functions of the life cycle of a dairy cow.

4 random variables

4 random variables to simulate the physiologic functions of the life cycle of a dairy cow.

- Time of natural death (assumed to be Weibull)
- Start of the reproductive cycle (Weibull)
- Number of unsuccessful inseminations (Geometric)
- Gestation time (Gaussian)

Parameter values allow the user to adapt to several scenarios.

4 random variables

Time of non-forced death

Weibull distribution with $a = 2$, $b = 1000(\log 2)^{-\frac{1}{a}}$ by default,

$$f(x; a, b) = \frac{a}{b} \left(\frac{x}{b}\right)^{a-1} e^{-\left(\frac{x}{b}\right)^a} \mathbf{1}_{[0, \infty]}(x), \text{ with } a, b > 0 \quad (1)$$

4 random variables

Time of non-forced death

Weibull distribution with $a = 2$, $b = 1000(\log 2)^{-\frac{1}{a}}$ by default,

$$f(x; a, b) = \frac{a}{b} \left(\frac{x}{b}\right)^{a-1} e^{-\left(\frac{x}{b}\right)^a} \mathbf{1}_{[0, \infty]}(x), \text{ with } a, b > 0 \quad (1)$$

4 random variables

Number of unsuccessful inseminations

Geometric distribution where $p \in (0, 1)$, $q = 1 - p$, with $p = 0.15$ by default:

$$P(X = n) = q^n p, \forall n \geq 0 \quad (2)$$

4 random variables

Number of unsuccessful inseminations

Geometric distribution where $p \in (0, 1)$, $q = 1 - p$, with $p = 0.15$ by default:

$$P(X = n) = q^n p, \forall n \geq 0 \quad (2)$$

4 random variables

Number of unsuccessful inseminations

```
availDists<-c(Geometric='rgeom')
updatePlot<-function(h,...){
  x j-do.call(availDists[svalue(distribution)],list(svalue(sampleSize),svalue(p)))
  t<-0:max(x)
  tab<-prop.table(prop.table(table(x)))
  dfx<-as.data.frame(tab)
  valors<-as.numeric(levels(dfx$x))
  f.rel<-dfx$Freq
  ymax<-max(f.rel,dgeom(t,svalue(p)))
  plot(t,dgeom(t,svalue(p)),type='p',col='red',lwd=1.5,ylim=c(0,ymax+.01),xlab='',ylab='')
  points(valors,f.rel,type='h',lwd=1.5)
  title(main=paste('Number of unsuccessul inseminations Geometric (p=',svalue(p),)'),
        sub='Theoretical probabilities (red points) and sample bars (black lines)')
  text(0.9*max(x),0.99*ymax,bquote(paste(P,scriptstyle(50)==.(round(median(x))))),col='gray')
  distribution<-gradio(names(availDists),horizontal=FALSE)
}
```

4 random variables

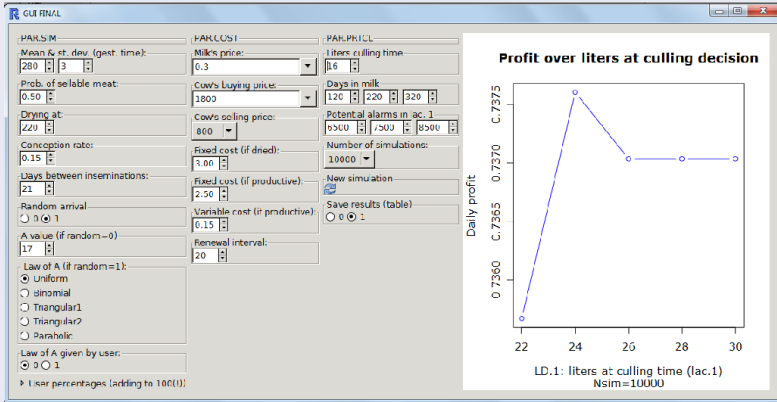

Number of unsuccessful inseminations

```
sampleSize<-gradio(c(50,100,200,400,800))
p<-gspinbutton(from=0,to=100,by=0.05,value=0.15)
refresh<-gimage('refresh',dirname='stock',handler=updatePlot)
window<-gwindow('Number of unsuccessful inseminations')

BigGroup<-ggroup(cont=window)

group<-ggroup(horizontal=FALSE,container=BigGroup)
tmp<-gframe('Distribution',container=group)
add(tmp,distribution)
tmp<-gframe('Sample size',container=group)
add(tmp,sampleSize)
tmp<-gframe('Rate',container=group)
add(tmp,p)
tmp<-gframe('Generate a new sample',container=group)
add(tmp,refresh)
add(BigGroup, ggraphics())
```

Final GUI

Conclusions

Conclusions

- We have created 4 auxiliary GUIs that can help in the modelization process.

Conclusions

- We have created 4 auxiliary GUIs that can help in the modelization process.
- Varying the values of the parameters allows the adaptation to different farms.

Conclusions

- We have created 4 auxiliary GUIs that can help in the modelization process.
- Varying the values of the parameters allows the adaptation to different farms.
- We have created a principal GUI containing all the methods, parameters, functions, replicates, etc., and showing the mean profit plot with respect to some threshold.

Conclusions

- We have created 4 auxiliary GUIs that can help in the modelization process.
- Varying the values of the parameters allows the adaptation to different farms.
- We have created a principal GUI containing all the methods, parameters, functions, replicates, etc., and showing the mean profit plot with respect to some threshold.
- In the example the maximum profit is achieved by taking the culling decision threshold at 24 liters.

Future work

- We now have the tools to interact with the model.

Future work

- We now have the tools to interact with the model.

Then,

Future work

- We now have the tools to interact with the model.

Then,

Test phase (1): testing the reliability of the models with actual cases.

Profit analysis (2): searching for those protocols that maximize the (mean) profit.

THANK YOU FOR YOUR ATTENTION
