# Background

## Cancer incidence and mortality

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- **Incidence and mortality cancer rates:**
  - usually defined as the number of **incident cases** or **deaths** in one single year, per 100,000 persons.
  - recorded by the **Incidence and Mortality Cancer Registries**, regional or population-based.
  - conventional epidemiological measures for **assessing cancer**.
  - rate trends and their modelling: key issue to evaluate the **impact of new treatments, health programs** or other epidemiological related issues.

TABLE 1. Incidence and Mortality Rates and Cumulative Probability of Developing Cancer by Age 75 by Sex and Cancer Site for More Developed and Less Developed Areas, 2008

	MORE DEVELOPED AREAS				LESS DEVELOPED AREAS			
	INCIDENCE		MORTALITY		INCIDENCE		MORTALITY	
	ASR	CUMULATIVE RISK (%) [AGE 0-74]	ASR	CUMULATIVE RISK (%) [AGE 0-74]	ASR	CUMULATIVE RISK (%) [AGE 0-74]	ASR	CUMULATIVE RISK (%) [AGE 0-74]
<b>Males</b>								
All cancers* (C00-97, but C44)	300.1	30.1	143.9	15.0	160.3	17.0	119.3	12.7
Bladder (C67)	16.6	1.9	4.6	0.5	5.4	0.6	2.6	0.3
Brain, nervous system (C70-72)	6.0	0.6	3.9	0.4	3.2	0.3	2.6	0.3
Colorectum (C18-21)	37.6	4.4	15.1	1.7	12.1	1.4	6.9	0.8
Esophagus (C15)	6.5	0.8	5.3	0.6	11.8	1.4	10.1	1.2
Gallbladder (C23-24)	2.4	0.3	1.6	0.2	1.4	0.2	1.1	0.1
Hodgkin lymphoma (C81)	2.2	0.2	0.4	0.0	0.9	0.1	0.6	0.1
Kidney (C64-66)	11.8	1.4	4.1	0.5	2.5	0.3	1.3	0.1
Larynx (C32)	5.5	0.7	2.4	0.3	3.5	0.4	2.1	0.3
Leukemia (C91-95)	9.1	0.9	4.8	0.5	4.5	0.4	3.7	0.3
Liver (C22)	8.1	1.0	7.2	0.9	18.9	2.2	17.4	2.0

# Background

## Predictions

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- Prediction of incidence or mortality rates **in the future**.
  - Important both from the **epidemiological** and **health planing** point of view and to assess the **burden of cancer**.
  - Used to **evaluate** the effect of the new health programs or treatments.
  - Most used models for prediction: **Age-period** or **age-period-cohort models** (Poisson distribution)
  - Historical data to **feed** predictions.
  - Prediction **out of the range** of observed values.

# Aims

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- To evaluate the **optimal number of years to make a prediction** in the future for incidence or mortality rates using age-period models.

# Methods

## Models for rate trends

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- $c_{it}$  and  $n_{it}$  number of incident cases or deaths and number of persons at risk in the population, respectively, for  $i$ th age group in the  $t$  period (year). Models:

- Model **AAAP** (*Additive Age-specific Age-Period*)

$$E\left(\frac{c_{it}}{n_{it}}\right) = \alpha_i + \beta_i t$$

- Model **MAAP** (*Multiplicative Age-specific Age-Period*)

$$\text{Model 'MAAP'} \quad \log\left(E\left(\frac{c_{it}}{n_{it}}\right)\right) = \alpha_i + \beta_i t$$

- Model **MAP** (*Multiplicative Age-specific Period*)

$$\text{Model 'MAP'} \quad \log\left(E\left(\frac{c_{it}}{n_{it}}\right)\right) = \alpha_i + \beta t$$

- $c_{it}$  **Poisson** distributed and **fixed**  $n_{it}$  .

# Methods

## Pearson goodness of the fit

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- Pearson goodness-of-fit statistic used to assess the model

$$\chi^2 = \sum_{i=1}^I \sum_{t=1}^T \frac{(c_{it} - \hat{c}_{it})^2}{\text{Var}(\hat{c}_{it})}$$

- Distributed as  $\chi^2$  on the residual degrees of freedom for the model

# Methods

## Analyses performed

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- Data of **mortality cancer rates** in **Spain** from 1951 to 2011 downloaded from WHO.
- Three cancer sites for women and men:
  - **Women**: breast, colorectal and lung cancer.
  - **Men**: lung, colorectal and prostate cancer.
- AAAP model when **increasing trends** and MAP or MAAP models when **decreasing trends**.

# Methods

## Analyses performed

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- Prediction made for each year in 1975 up to 2011
- Prediction using data historical data 5 years before the prediction.
- Basis period for prediction: 1, 2, ..., 20 last years

# Methods

## Analyses performed

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- Different basis period time for the prediction
  - Last year
  - Last 5 years
  - Last 10 years
  - Last 20 years
  - *GoF-optimal* number of years
- *GoF-optimal* number of years: **smallest period of time** where the model fits, according to Pearson's GoF statistic

# Methods

## Analyses performed

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- Comparison of the different methods (1,5,10,20 last years or GoF-optimal):
  - For each year predicted (1975 up to 2011) obtention of 95% confidence interval for the predicted number of deaths.
  - Boolean evaluation of the inclusion of the true observed value respect to the interval.
  - Computation of a whole coverage (% years where the true value is inside the interval).

Women					
Breast	5.56 %	63.89 %	30.56 %	16.67 %	75 %
Colorectal	27.78 %	50 %	13.89 %	2.78 %	66.67 %
Lung	38.89 %	94.44 %	47.22 %	5.56 %	97.22%

# Discussion

Optimal number of years to make a prediction for mortality or incidence rates

Background

Aims

Methods

Results

Discussion

- Simple method with reasonable results and useful at practice.
- Good alternative to choosing a subjective number of years.
- Results supporting that large historical data are not needed for a prediction.
- Limitations:
  - Ongoing results: more results with new tumor sites and countries.
  - Not possible to establish general statistical properties from particular data sets.
