

# Economics, and the Real-World

## Orthodox Economics, Confronted to the Real Workings of our Economies

### Contents

#### Introduction and objectives:

Economics, as a science –or seen it from the outlook of Scientifics from others fields

#### 1. Structure of the Standard Model assumptions, to be confronted with observational evidences

Appendix A: Summary of the assumptions, axioms, and postulates of the Economics Standard Model

#### 2. The *mainstream* Economics taught in classrooms and textbooks: A theory of the firm (or of production) and markets.

- 2.1 The standard theory of unit-cost in the short-run, or static analysis: A firm in operation, with a given production structure or size.
- 2.2 The standard theory of units costs in the long run, or dynamic analysis: Firms' size is a decisional variable, it changes over time.
- 2.3 What underpins the ESM's conventional assumption of "*decreasing returns* when firms grow beyond a given point".
- 2.4 The 'production function', a math device to also speak of 'returns to scale'
- 2.5 The 'Supply Curve' and the standard formulation of 'market equilibrium' in the ESM.
- 2.6 The minority assumption in manuals: constant returns ('lying down 'L' hypothesis)

#### 3. The workings of the economy, according to empirical evidence: the production sphere, and firms' dynamics.

- 3.1 A realistic scheme for the 'production' context: The network of firms → products → costs.
- 3.2 Empirical evidence on the general pattern of Costs, in relation to the activity level of an enterprise.
- 3.3 The pattern of unit-costs, according to empirical evidence: (I) In the short-run, or static analysis: a firm with a given structure/dimension).
- 3.4 The pattern of unit-costs according to empirical evidence: (II) In the long-run, (or dynamic analysis: the structure/size of a firm varies over time).
- 3.5 The '*decreasing returns*' axiom cannot be sustained.
- 3.6 What specific studies tell us about *economies of scale*.
- 3.7 *Non-decreasing* returns: Empirical evidence repeatedly exposed though curiously ignored.

Appendix B: Quantitative simulation for the overall pattern of short-run average cost.

Appendix C: The oil market in the USA; Production units vs. Price

#### **4. Prices, markets situations, and business behaviour, according to empirical observations.**

- 4.1 Selling prices and firms' behaviour: Observational evidence.
- 4.2 Market structures most generally observed in real economies.
- 4.3 Cases of *natural monopoly*: The restrictive approach of the Standard Model , faced to empirical evidence.

Appendix D: The theoretical inconsistency of *Marginal Cost Pricing*.

#### **5. Dropping-out unreasonable simplifications:** Taking into account the determinant realities of: One-firm=several products; product differentiation; foreign trade; income inequalities, Public Sector, and 'externalities'.

- 5.1 Product differentiation –an omnipresent, and determining, reality
- 5.2 Multi-product (one firm = several products), the most common situation: Repercussion on the formal explanatory scheme.
- 5.3 Foreign Trade; what changes into the explanatory scheme when moving on to take it into account.
- 5.4 Economic inequalities, Public Sector, and Externalities: issues relegated in the mainstream

Appendix E: The basic 'Ricardian' model of '*comparative advantages and international trade*'

Appendix F: Historical data on Trade Balance for populated countries in three worldwide regions (1977-2018).

#### **6. Towards a really explanatory discipline**

- 6.1 Unnecessary unrealism to be overcome.
- 6.2 Empirical-inductive models of the world of Production and of Firms' behaviour.
- 6.3 A look at current research in Economics (Micro-):  
The empiricist paradox regarding mainstream economics.
- 6.4 Economic theory works, and quantum of knowledge provided

Appendix G: A brief on the contents of the arbitrarily-at-random sample of research papers used in 6.3

#### **7. Economics to explain the workings of our real economies**

- 7.1 A realistic explanatory model of the supply side of the market for a given product or service
- 7.2 Empirically induced models of Prices formation, Enterprises' profits, and Markets' structures
- 7.3 Socio-political incidence of mainstream Economics' standard model; 'Competition' used as a myth
